INVESTOR IN PEOPLE

The Patent Office
 Concept House
 Cardiff Road
 Newport
 South Wales
 NP10 8QQ

REC'D 13 JAN 2005	
WIPO	PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed *AmBrewster*

Dated 24 December 2004

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.*
- Write your answers in capital letters using black ink or you may type them.*
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.*
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.*
- Once you have filled in the form you must remember to sign and date it.*
- For details of the fee and ways to pay please contact the Patent Office.*

THERAPEUTIC TREATMENT

This invention relates to the use of methods and materials for therapeutic treatment of the human body. In particular, it provides methods of treating diseases associated with the deposition of β -amyloid in the brain, such as Alzheimer's disease, or of preventing or delaying the onset of dementia associated with such diseases.

Alzheimer's disease (AD) is the most prevalent form of dementia. Its diagnosis is described in the Diagnostic and Statistical Manual of Mental Disorders, 4th ed., published by the American Psychiatric Association (DSM-IV). It is a neurodegenerative disorder, clinically characterized by progressive loss of memory and general cognitive function, and pathologically characterized by the deposition of extracellular proteinaceous plaques in the cortical and associative brain regions of sufferers. These plaques mainly comprise fibrillar aggregates of β -amyloid peptide ($A\beta$). $A\beta$ is formed from amyloid precursor protein (APP) via separate intracellular proteolytic events involving the enzymes β -secretase and γ -secretase. After secretion into the extracellular medium, the initially-soluble $A\beta$ forms aggregates which ultimately result in the insoluble deposits and dense neuritic plaques which are the pathological characteristics of AD. Various interventions in the plaque-forming process have been proposed as therapeutic treatments for AD (see, for example, Hardy and Selkoe, *Science*, 297 (2002), 353-6).

Other dementing conditions associated with deposition of $A\beta$ in the brain include cerebral amyloid angiopathy, hereditary cerebral haemorrhage with amyloidosis, Dutch-type (HCHWA-D), multi-infarct dementia, dementia pugilistica and Down syndrome.

Carro et al, in *Nature Medicine*, 8 (2002), 1390-7, disclose that subcutaneous administration of insulin-like growth factor 1 (IGF-1) causes a reduction in the cerebral A burden in certain rodents. However, some evidence suggests that interference with brain $A\beta$ levels may be linked with adverse effects in humans (see *New Scientist*, Feb. 1 2003, 35-7).

Growth hormone has been proposed for use in treatment of AD. Thus, US 4,902,680 advocates the administration of growth hormone to patients in the advanced stages of AD, while WO 00/13650 discloses that increased levels of growth hormone

in the brain provide a neuroprotective effect, and in particular can rescue neurons that would otherwise die as a result of an insult such as that associated with a neurodegenerative disease such as AD. The injection of growth hormone into the brain is contemplated.

5 Growth hormone secretagogues (GHSs) are compounds which, when administered to an animal (such as a human), stimulate or increase the release of endogenous growth hormone in the animal. Their mode of action and clinical utilities are reviewed by Ankersen et al, *Drug Discovery Today*, 4 (1999), 497-506; Casanueva and Dieguez, *TEM*, 10 (1999), 30-8; Smith et al, *ibid.*, 10 (1999), 128-35; Betancourt
10 and Smith, *J. Anti-Aging Med.*, 5 (2002), 63-72; and Ghigo et al, *ibid.*, 5 (2002), 345-56, but there is no mention of treating AD or any other neurodegenerative condition. Patents and patent applications disclosing compounds which are GHSs include US 5,767,124, US 5,536,716, WO 94/13696, EP 0615977B, US 5,578,593; WO 01/04119, WO 98/25897, WO 98/10653, WO 97/36873, WO 97/34604, WO
15 97/15574, WO 97/11697, WO 96/32943, WO 96/13265, WO 96/02530, WO 95/34311, WO 95/14666, WO 95/13069, WO 94/19367, WO 94/05634 and WO 92/16524 (all assigned to Merck & Co., Inc.); EP 1002802A, EP 0995748A, WO 98/58948, WO 98/58947 and WO 97/24369 (all assigned to Pfizer Inc.); WO 01/34593, WO 00/26252, WO 00/01726, WO 99/64456, WO 99/58501, WO
20 99/36431, WO 98/58950, WO 98/08492, WO 98/03473, WO 97/40071, WO 97/40023, WO 97/23508, WO 97/00894, WO 96/24587, WO 96/24580, WO 96/22997, WO 95/17423 and WO 95/17422 (all assigned to Novo Nordisk A/S); WO 96/15148 (Genentech Inc.); WO 97/22620 (Deghenghi); WO 02/32888, WO 02/32878, WO 00/49037, WO 00/10565 and WO 99/08699 (all assigned to Eli Lilly and Co.); WO 02/057241 and WO 02/056873 (both assigned to Bayer Corp.); and WO
25 01/85695, WO 00/54729 and WO 00/24398 (all assigned to Bristol-Myers Squibb Co.). The compounds are recommended for use in promoting the growth of food animals, and in humans for treating physiological or medical conditions characterised by a deficiency in growth hormone secretion, and medical conditions which are
30 improved by the anabolic effects of growth hormone. In some of the above-listed disclosures, the list of treatable conditions includes AD.

The compound disclosed in the aforementioned US 5,767,124 has been the subject of a number of clinical trials in therapeutic fields unrelated to AD (see, for example, Murphy et al, *J. Bone Miner. Res.*, **14**, (1999), 1182-8; Chapman et al, *J. Clinical Endocrinology and Metabolism*, **81**, (1996), 4249-57; *ibid.*, **82**, (1997), 3455-63; and Svensson et al, *ibid.*, **83**, (1998), 362-9).

Mitogen activated protein kinases (MAPKs) are a family of serine/threonine protein kinases that play a critical role in transducing multiple signals from the cell surface to the nucleus in all eukaryotic species. A subgroup of MAPKs includes the stress-activated protein kinases, of which p38 is an example. p38 exists α , β , γ and δ isoforms and has a major role in the production and action of a number of pro-inflammatory mediators. Consequently, inhibitors of p38 kinase have been suggested for use in treating a variety of inflammatory disorders such as arthritis in its various forms and autoimmune diseases. p38, and p38 α in particular, has also been implicated in the signalling pathways leading to apoptosis in neurodegenerative diseases such as Parkinson's disease, Alzheimer's disease, Huntingdon's disease, amyotrophic lateral sclerosis and ischaemia (see, for example, Harper and Wilkie, *Expert Opin. Ther. Targets*, 2003, **7**, 187-200; Dalrymple, *J. Mol. Neurosci.*, 2002, **19**, 295-9; and Zhu et al, *Neurosignals*, 2002, **11**, 270-81). Thus, p38 kinase inhibitors have been suggested as a means of controlling the neurotoxic effects of intracerebral A β . However, there has hitherto been no suggestion of any role for p38 kinase inhibitors in controlling the accumulation of A β in the brain.

According to the invention, there is provided the use of a growth hormone secretagogue and a p38 kinase inhibitor for the manufacture of a medicament for treatment or prevention of Alzheimer's disease.

According to a second aspect of the invention, there is provided the use of a growth hormone secretagogue and a p38 kinase inhibitor for the manufacture of a medicament for treatment, prevention or delaying the onset of dementia associated with Alzheimer's disease, cerebral amyloid angiopathy, HCHWA-D, multi-infarct dementia, dementia pugilistica or Down syndrome.

The invention also provides a method of treatment or prevention of Alzheimer's disease comprising administering to a subject in need thereof a

therapeutically effective amount of a growth hormone secretagogue in combination with a therapeutically effective amount of a p38 kinase inhibitor.

The invention further provides a method of treating, preventing or delaying the onset of dementia associated with Alzheimer's disease, cerebral amyloid angiopathy, HCHWA-D, multi-infarct dementia, dementia pugilistica or Down syndrome comprising administering to a patient in need thereof a therapeutically effective amount of a growth hormone secretagogue in combination with a therapeutically effective amount of a p38 kinase inhibitor.

As used herein, the expression "in combination with" requires that therapeutically effective amounts of both a GHS and a p38 kinase inhibitor are administered to the subject, but places no restriction on the manner in which this is achieved. Thus, the two species may be combined in a single dosage form for simultaneous administration to the subject, or may be provided in separate dosage forms for simultaneous or sequential administration to the subject. Sequential administration may be close in time or remote in time, e.g. one species administered in the morning and the other in the evening. The separate species may be administered at the same frequency or at different frequencies, e.g. one species once a day and the other two or more times a day. The separate species may be administered by the same route or by different routes, e.g. one species orally and the other parenterally, although oral administration of both species is preferred.

The GHS and p38 kinase inhibitor act synergistically in promoting the clearance of A β from the brain. Therefore, in a further aspect the invention provides a method for retarding, arresting or preventing the accumulation of A β in the brain comprising administering to a subject in need thereof a therapeutically effective amount of a growth hormone secretagogue in combination with a therapeutically effective amount of a p38 kinase inhibitor. Clearance of A β from the brain following administration of the relevant compounds may be evidenced by an increase in the level of soluble A β in the cerebrospinal fluid and/or the plasma. Alternatively (or additionally), imaging techniques such as magnetic resonance imaging, positron emission tomography, single photon emission computed tomography and multiphoton

microscopy may be employed to monitor the extent of A β deposition in the brain (see, for example, Bacskai *et al.*, *J. Cereb. Blood Flow Metab.*, **22** (2002), 1035-41).

In one embodiment of the invention, the GHS and p38 kinase inhibitor are administered to a patient suffering from AD, cerebral amyloid angiopathy, HCHWA-D, multi-infarct dementia, dementia pugilistica or Down syndrome, preferably AD.

In an alternative embodiment of the invention, the GHS and p38 kinase inhibitor are administered to a patient suffering from mild cognitive impairment or age-related cognitive decline. A favourable outcome of such treatment is prevention or delay of the onset of AD. Age-related cognitive decline and mild cognitive impairment (MCI) are conditions in which a memory deficit is present, but other diagnostic criteria for dementia are absent (Santacruz and Swagerty, *American Family Physician*, **63** (2001), 703-13). (See also "The ICD-10 Classification of Mental and Behavioural Disorders", Geneva: World Health Organisation, 1992, 64-5). As used herein, "age-related cognitive decline" implies a decline of at least six months' duration in at least one of: memory and learning; attention and concentration; thinking; language; and visuospatial functioning and a score of more than one standard deviation below the norm on standardized neuropsychologic testing such as the MMSE. In particular, there may be a progressive decline in memory. In the more severe condition MCI, the degree of memory impairment is outside the range considered normal for the age of the patient but AD is not present. The differential diagnosis of MCI and mild AD is described by Petersen *et al.*, *Arch. Neurol.*, **56** (1999), 303-8.

Within this embodiment, the GHS and p38 kinase inhibitor are advantageously administered to patients who suffer impaired memory function but do not exhibit symptoms of dementia. Such impairment of memory function typically is not attributable to systemic or cerebral disease, such as stroke or metabolic disorders caused by pituitary dysfunction. Such patients may be in particular people aged 55 or over, especially people aged 60 or over, and preferably people aged 65 or over. Such patients may have normal patterns and levels of growth hormone secretion for their age. However, such patients may possess one or more additional risk factors for developing Alzheimer's disease. Such factors include a family history of the disease;

a genetic predisposition to the disease; elevated serum cholesterol; and adult-onset diabetes mellitus.

In a particular embodiment of the invention, GHS and p38 kinase inhibitor are administered to a patient suffering from age-related cognitive decline or MCI who additionally possesses one or more risk factors for developing AD selected from: a family history of the disease; a genetic predisposition to the disease; elevated serum cholesterol; and adult-onset diabetes mellitus.

A genetic predisposition (especially towards early onset AD) can arise from point mutations in one or more of a number of genes, including the APP, presenilin-1 and presenilin-2 genes. Also, subjects who are homozygous for the $\epsilon 4$ isoform of the apolipoprotein E gene are at greater risk of developing AD.

The patient's degree of cognitive decline or impairment is advantageously assessed at regular intervals before, during and/or after a course of treatment with the compound of formula I or a pharmaceutically acceptable salt thereof, so that changes therein may be detected, e.g. the slowing or halting of cognitive decline. A variety of neuropsychological tests are known in the art for this purpose, such as the Mini-Mental State Examination (MMSE) with norms adjusted for age and education (Folstein *et al.*, *J. Psych. Res.*, **12** (1975), 196-198, Anthony *et al.*, *Psychological Med.*, **12** (1982), 397-408; Cockrell *et al.*, *Psychopharmacology*, **24** (1988), 689-692; Crum *et al.*, *J. Am. Med. Assoc'n.* **18** (1993), 2386-2391). The MMSE is a brief, quantitative measure of cognitive status in adults. It can be used to screen for cognitive decline or impairment, to estimate the severity of cognitive decline or impairment at a given point in time, to follow the course of cognitive changes in an individual over time, and to document an individual's response to treatment. Another suitable test is the Alzheimer Disease Assessment Scale (ADAS), in particular the cognitive element thereof (ADAS-cog) (See Rosen *et al.*, *Am. J. Psychiatry*, **141** (1984), 1356-64).

The invention further provides a kit comprising a first medicament comprising a GHS and a second medicament comprising a p38 kinase inhibitor together with instructions for administering said medicaments sequentially or simultaneously to a patient suffering from AD, age-related cognitive decline, MCI, cerebral amyloid

angiopathy, HCHWA-D, multi-infarct dementia, dementia pugilistica or Down syndrome.

The GHS used in the invention may be any compound which has the property of stimulating or enhancing secretion of endogenous growth hormone when administered to a subject, for example any of the compounds disclosed in the patents and patent applications listed above. However, preference is given to compounds which are suitable for oral administration.

A first class of GHSs suitable for use in the invention is that disclosed in WO 94/13696, in particular the subset thereof disclosed in EP 0615977B, the disclosure of which is incorporated herein by reference. Preferred examples of GHSs within this class include the compound of formula I:

named as N-[1(R)-[(1,2-dihydro-1-methanesulfonylspiro[3H-indole-3,4'-piperidin]-1'-yl)carbonyl]-2-(phenylmethoxy)ethyl]-2-amino-2-methylpropanamide, and pharmaceutically acceptable salts thereof, in particular the methanesulfonate salt thereof, which may be prepared as described in US 5,767,124.

A second class of GHSs suitable for use in the invention is that disclosed in US 5,578,593, the disclosure of which is incorporated herein by reference. Preferred example of GHSs within this class include the compound of formula II:

II

and pharmaceutically acceptable salts thereof, which may be prepared as described in US 5,578,593.

5 A third class of GHSs suitable for use in the invention is that disclosed in WO 92/16524, the disclosure of which is incorporated herein by reference. Preferred example of GHSs within this class include the compounds of formulae III and IV:

III

IV

and pharmaceutically acceptable salts thereof, in particular the trifluoroacetate salts thereof, which may be prepared as described in WO 92/16524.

10 A fourth class of GHSs suitable for use in the invention is that disclosed in WO 97/23508, the disclosure of which is incorporated herein by reference. Preferred examples of GHSs within this class include the compound of formula V, also known as NN703:

and pharmaceutically acceptable salts thereof, which may be prepared as described in WO 99/64456.

A fifth class of GHSs suitable for use in the invention is that disclosed in WO 97/24369, the disclosure of which is incorporated herein by reference. Preferred examples of GHSs within this class include the compound of formula VI:

named as 2-amino-N-[2-(3a-(R)-benzyl-2-methyl-3-oxo-2,3,3a,4,6,7-hexahydro-pyrazolo[4,3-c]pyridin-5-yl)-1-(R)-benzyloxymethyl-2-oxo-ethyl]-isobutyramide, and pharmaceutically acceptable salts thereof, in particular the L-tartrate salt, also known as capromorelin, which may be prepared as described in WO 97/24369 and in Carpino et al, *Bioorg. Med. Chem.*, 11 (2003), 581-90.

A sixth class of GHSs suitable for use in the invention is that disclosed in WO 98/58947, the disclosure of which is incorporated herein by reference. Preferred examples of GHSs within this class include the compound of formula VII:

and pharmaceutically acceptable salts thereof, which may be prepared as described in WO 98/58947.

A seventh class of GHSs suitable for use in the invention is that disclosed in
 5 WO 99/08699, the disclosure of which is incorporated herein by reference. Preferred examples of GHSs within this class include the compound of formula VIII:

and pharmaceutically acceptable salts thereof, which may be prepared as described in WO 99/08699 and WO 02/32878.

10 Further GHSs suitable for use in the invention include the compound of formula IX;

IX

and pharmaceutically acceptable salts thereof, which may be prepared as described in De Vita et al, *J.Med.Chem.*, **41** (1998), 1716-28, and the compound of formula X:

X

5 and pharmaceutically acceptable salts thereof, which may be prepared as described in Yang et al, *J.Med.Chem.*, **41** (1998), 2439-41.

The p38 kinase inhibitor may in principle be any compound known to inhibit p38 kinase. Assays to identify such compounds are well known in the art and are described, for example, in WO 02/058695 and WO 01/64679. The p38 kinase inhibitor is preferably selective for the α isoform, and in particular selective for the α isoform over the γ and δ isoforms. Preference is also given to compounds suitable for oral administration. Examples of suitable p38 kinase inhibitors include minocycline (Lin et al, *Neurosci. Lett.*, 2001, **315**, 61-4); doramapimod (WO 02/07772); SB-239063 (Ward et al, *Pharmaceutical Research*, 2001, **18**, 1336-44); the compounds identified as VX-702 (Vertex Pharmaceuticals Inc.), SCIO-469 and SCIO-323 (Scios Inc.), 681323 (GlaxoSmithKline plc), AMG-548 (Amgen Inc.) and CT-8730 (Celltech Group plc); and compounds disclosed in patents such as WO 97/05877, WO 97/05878, WO 97/12876, WO 97/16442, WO 97/47618, WO 00/31065,

WO 01/01988, WO 01/00208, WO 00/69848, WO 01/22965, WO 00/06563,
WO 01/42241, WO 02/058695, WO 01/64679, US 03/17821, WO 03/000682,
US 03/14777. Preferred p38 kinase inhibitors include the compounds of formula XI:

or pharmaceutically acceptable salts thereof, wherein
Non-Ar-Cyc is

A is N, O, NH, CH₂, or CH;

B is -C₁₋₆alkyl-, -C₀₋₃alkyl-O-C₀₋₃alkyl-, -C₀₋₃alkyl-NH-C₀₋₃alkyl-, -C₀₋₃alkyl-NH-C₃₋₇cycloalkyl-, -C₀₋₃alkyl-N(C₀₋₃alkyl)-C(O)-C₀₋₃alkyl-, -C₀₋₃alkyl-NH-SO₂-C₀₋₃alkyl-, -C₀₋₃alkyl-, -C₀₋₃alkyl-S-C₀₋₃alkyl-, -C₀₋₃alkyl-SO₂-C₀₋₃alkyl-, -C₀₋₃alkyl-PH-C₀₋₃alkyl-, -C₀₋₃alkyl-C(O)-C₀₋₃alkyl, or a direct bond;

D is CH, CH₂, N, or NH; optionally A and D are bridged by -C₁₋₄alkyl- to form a fused bicyclo ring with A and D at the bicyclo cusps;

E¹ is CH, N, or CR⁶; or B and E¹ form -CH=C<;

E² is CH₂, CHR, C(OH)R, NH, NR, O, S, -S(O)-, or -S(O)₂-;

G¹ is N, CH, or C(C₁₋₃alkyl);

G² is N, CH, or C(C₁₋₃alkyl);

R, R⁷ and R⁷⁷ each independently is hydrogen, C₁₋₆alkyl- group, C₂₋₆alkenyl- group, C₄₋₆cycloalkyl-C₀₋₆alkyl- group, N(C₀₋₄alkyl)(C₀₋₄alkyl)-C₁₋₄alkyl-N(C₀₋₄alkyl)- group, -N(C₀₋₄alkyl)(C₀₋₄alkyl) group, C₁₋₃alkyl-CO-C₀₋₄alkyl- group, C₀₋₆alkyl-O-C(O)-C₀₋₄alkyl- group, C₀₋₆alkyl-C(O)-O-C₀₋₄alkyl- group, N(C₀₋₄alkyl)(C₀₋₄alkyl)-(C₀₋₄alkyl)C(O)(C₀₋₄alkyl)- group, phenyl-C₀₋₄alkyl- group, pyridyl-C₀₋₄alkyl- group, pyrimidinyl-C₀₋₄alkyl- group, pyrazinyl-C₀₋₄alkyl- group, thiophenyl-C₀₋₄alkyl- group, pyrazolyl-C₀₋₄alkyl- group, imidazolyl-C₀₋₄alkyl- group, triazolyl-C₀₋₄alkyl- group, azetidyl-C₀₋₄alkyl- group, pyrrolidinyl-C₀₋₄alkyl- group, isoquinolinyl-C₀₋₄alkyl- group, indanyl-C₀₋₄alkyl- group, benzothiazolyl-C₀₋₄alkyl- group, any of the groups optionally substituted with 1-6 substituents, each substituent independently being -OH, -N(C₀₋

4alkyl)(C₀₋₄alkyl), C₁₋₄alkyl, C₁₋₆alkoxyl, C₁₋₆alkyl-CO-C₀₋₄alkyl-,
pyrrolidinyl-C₀₋₄alkyl-, or halogen;

or R⁷ together with a bond from an absent ring hydrogen is =O;

n' + n'' = n;

5

m' + m'' = m;

n is 1, 2, 3, or 4;

m is 0, 1, 2, 3, or 4;

n+m is 2, 3, 4, 5, or 6;

p is 0, 1, 2, or 3;

10

R¹, R², R³, R⁴, and R⁶ are each independently halogen, C₀₋₄alkyl, -

C(O)-O(C₀₋₄alkyl), or -C(O)-N(C₀₋₄alkyl)(C₀₋₄alkyl);

R⁵ and R⁵⁵ independently is H, CH₃, CH₂CH₃, or absent;

R⁸⁸ and R⁸ each is independently -CN, -C₀₋₄alkyl, -C(O)-N(C₀₋₄alkyl)(C₀₋₄alkyl), -C(O)-O-C₀₋₄alkyl or 1,3-dioxolan-2-yl-C₀₋₄alkyl-;

15

R⁹ is -C₀₋₄alkyl, or absent; and

any alkyl is optionally substituted with 1-6 independent halogen or -OH.

In a particular embodiment, Non-Ar-Cyc is

20

A is CH, D is CH and G² is N.

Such compounds may be prepared as described in WO 02/058695.

In a particularly preferred embodiment of the invention, the GHS is the
methanesulfonate salt of N-[1(R)-[(1,2-dihydro-1-methanesulfonylspiro[3H-indole-
25 3,4'-piperidin]-1'-yl)carbonyl]-2-(phenylmethyloxy)ethyl]-2-amino-2-
methylpropanamide and the p38 kinase inhibitor is the compound of formula XI.

Depending on whether they are to be administered together or separately, the
GHS and p38 kinase inhibitor are typically supplied as single or multiple
pharmaceutical compositions comprising the active species and a pharmaceutically
30 acceptable carrier. Preferably these compositions are in unit dosage forms such as

tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, metered aerosol or liquid sprays, drops, ampoules, transdermal patches, auto-injector devices or suppositories; for oral, parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. The principal active ingredient typically is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate and dicalcium phosphate, or gums, dispersing agents, suspending agents or surfactants such as sorbitan monooleate and poly(ethylene glycol), and other pharmaceutical diluents, e.g. water, to form a homogeneous preformulation composition containing one or both active species, or pharmaceutically acceptable salts thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active species is or are dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This preformulation composition is then subdivided into unit dosage forms of the type described above, generally containing from 0.01 to about 500 mg of the active species. Typical unit dosage forms contain from 0.05 to 100 mg, for example 0.05, 0.1, 0.5, 1, 2, 5, 10, 25, 50 or 100 mg, of the active species. Tablets or pills of the pharmaceutical composition(s) can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the pharmaceutical compositions useful in the present invention may be incorporated for administration orally or by injection include aqueous solutions, liquid- or gel-filled capsules, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical

vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, poly(ethylene glycol), poly(vinylpyrrolidone) and gelatin.

5 Pharmaceutical compositions suitable for oral administration are preferred.

For treatment or prevention of AD, the GHS and p38 kinase inhibitor may be dosed at the levels which are effective for the original purposes of the separate compounds. Thus, the GHS will typically be dosed at levels known to provide increased secretion of endogenous growth hormone in a human subject, and the p38
10 kinase inhibitor at levels known to cause significant inhibition of the PDE4 enzyme in humans. In many cases, these dosage levels are available from the published literature, but otherwise are readily determined by standard clinical methods.

The frequency of dosing of the relevant compounds (e.g. once, twice, three times or four times per day) may be selected according to the pharmacokinetic profiles
15 of the compounds concerned.

In the case of the preferred GHS of formula I, doses of about 0.01 to 5.0 mg/kg per day, preferably about 0.05 to 2.5 mg/kg per day, more preferably about 0.1 to 1.0 mg/kg of body weight per day, may be contemplated. In particular, a dose equivalent to 5mg, 10 mg or 25 mg of the free base may be administered orally once daily to a
20 patient.

In the case of the p38 kinase inhibitor of formula XI, doses of about 0.01 to 5.0 mg/kg per day may be contemplated.

In the case of doramapimod, a dose of about 30 mg per person once or twice daily may be contemplated.

25 In a further aspect, the invention provides a pharmaceutical composition comprising, in a pharmaceutically acceptable carrier, a compound of formula I or a pharmaceutically acceptable salt thereof and a compound of formula XI or a pharmaceutically acceptable salt thereof. Preferably the compound of formula I is in the form of the methanesulfonate salt. Preferably, the pharmaceutical composition is
30 in a unit dose form suitable for oral administration, such as a tablet or a capsule.
